

A. Ventricular Fibrillation/Pulseless VT

Ventricular Fibrillation/Pulseless Ventricular Tachycardia Sequence: Prepare next drug prior to rhythm check. Administer drug during CPR, as soon as possible after the rhythm check confirms VF/pulseless VT. Do not delay shock. Continue CPR while drugs are prepared and administered and defibrillator is charging. Ideally, chest compressions should be interrupted only for ventilation (until advanced airway placed), rhythm check, and actual shock delivery.
